Page Object Model

Why Page Object Model?

- Building a test framework
- Easily maintain and update page elements
- Create simple, clean tests
- Simplify the purpose for each class

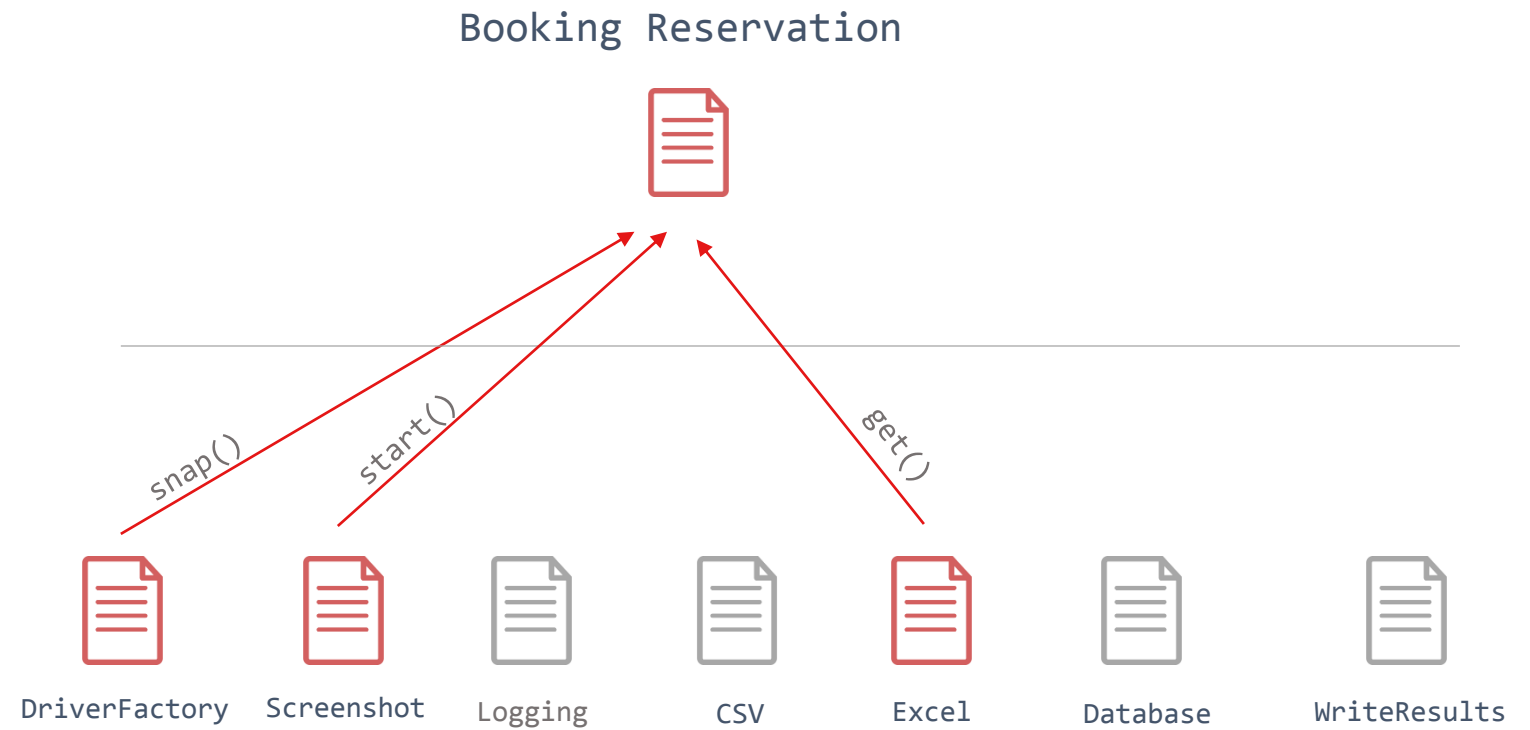

So far, we have written
our tests in one class file.

Challenges with Tests:

- *Not very readable*
- *Not easy to update page elements*
- *Not easy to modify test steps*
- *What if we wanted to run a test involving many of the same steps?*

POM Solution: Split into Two Classes

One for the test steps, one for the page elements

Enhance POM with PageFactory

Use the constructor method to initialize Web Elements using the PageFactory.init method
